

Hi,

I am Prem Prakash, i am persuing my B.E (2007-11) in ECE discipline from TIT BHOPAL. The test pattern is:

1. aptitude test only 35 questions 80 minutes. (15/01/2011)
2. technical round (16/01/2011)
3. HR (06/01/2011)

I am going to share some aptitude, tr and hr questions

1. Out of 7 children the youngest is boy then find the probability that all the remaining children are boys  
a)  $1/64$  b)  $1/32$  c)  $1/128$  d)  $1/256$

ans: probability =  $(1/2)^6 = 1/64$

2. On planet Korba, a solar blast has melted the ice caps on its equator. 9 years after the ice melts, tiny planetoids called echina start growing on the rocks. Echina grows in the form of circle, and the relationship between the diameter of this circle and the age of echina is given by the formula  $d = 4\sqrt{t-9}$  for  $t \geq 9$  where  $d$  represents the diameter in mm and  $t$  the number of years since the solar blast. Jagan recorded the radius of some echina at a particular spot as 7mm. How many years back did the solar blast occur?

- a) 17 b) 21.25 c) 12.25 d) 14.05

ans: put  $d=7$  in given equation and square both side and then find the value of  $t$ .

3. Ferrari S.P.A is an Italian sports car manufacturer based in Maranello, Italy. Founded by Enzo Ferrari in 1928 as Scuderia Ferrari, the company sponsored drivers and manufactured race cars before moving into production of street-legal vehicles in 1947 as Ferrari S.P.A. Throughout its history, the company has been noted for its continued participation in racing, especially in Formula One where it has employed great success. Rohit once bought a Ferrari. It could go 4 times as fast as Mohan's old Mercedes. If the speed of Mohan's Mercedes is 35 km/hr and the distance traveled by the Ferrari is 490 km, find the total time taken for Rohit to drive that distance.

- a) 20.72 b) 3.5 c) 238.25 d) 6.18

ans: Ferrari speed =  $4 \times$  Mercedes speed =  $4 \times 35 = 140$ ,  $t = 490/140 = 3.5$

4.  $1/3$  of a number is 3 more than the  $1/6$  of the same number?  
a) 6 b) 7 c) 18 d) 9

ans:  $x/3 = 3 + x/6$   $x/3 - x/6 = 3$   $x/6 = 3$   $x = 18$

5. There are two water tanks A and B, A is much smaller than B. While water fills at the rate of 1 liter every hour in A, it gets filled up like, 10, 20, 40, 80, 160 in tank B. (At the end of first hour, B has 10 liters, second hour it has 20 liters and so on). If tank B is  $1/32$  filled of the 26 hours, what is total duration of hours required to fill it completely?

- a) 26 b) 31 c) 5 d) 27

ans:  $1/32$  in 26

$2/32$  in 27

4/32 in 28

8/32 in 29

16/32 in 30

32/32 in 31

6. lady has fine gloves and hats in her closet- 14 blue, 20 red, and 18 yellow. The lights are out and it is totally dark. In spite of the darkness, she can make out the difference between a hat and a glove. She takes out an item out of the closet only if she is sure that if it is a glove. How many gloves must she take out to make sure she has a pair of each color?

a) 50 b) 8 c) 40 d) 42

Solution:

This is the most repeated question in Tcs so prepare it well. It has no logic but it's answer comes like this

Firstly add 2 max values i.e  $20+18=38$

Then add 2 to answer i.e.  $38+2=40$  so this is the answer.

7. There is a square. 5 circles are kept on the diagonal of the square such that the two extreme circles touch the two sides of the square. Each circle has equal radius. Find the ratio of side of the square to that of the radius.

ans: diagonal =  $(\sqrt{2}) * a$ ,  $a$  = side of the square.

The addition of diameters of all the circles is equal to  $(\sqrt{2}) * a$

$2 * 7 * r = (\sqrt{2}) * a$

But the two extreme circles will not touch at the corners so we have to find those distances.

$x$  = distance at one corner =  $r * ((\sqrt{2}) - 1)$

But total distance =  $2 * x$  due to 2nd corner

Hence total distance =  $2 * x + 2 * 7 * r$

or  $2 * x + 2 * 7 * r = (\sqrt{2}) * a$

Now you can find the ratio easily.

I think that this is one of the most conceptual questions in the paper.

8. A sheet of paper has statements numbered from 1 to 20. Statement  $n$  says "At least  $n$  of the statements on this sheet are true". Which statements are true and which are false.

a. The even no statements are true and the odd no statements are false.

b. The 1st 13 statements are false and rest are true.

c. The 1st 6 statements are true and rest are false

d. The odd no statements are true and even no. are false.

Solution: This type of question was repeated 3 times but for different cases.

For this type of Questions, follow this:

At least- 1st half are true, Last half are false

Exactly- Last second one is true or  $(N-1)$ th Statement is true

Almost- All are true.

So correct answer is (C)

9. On the planet Oz, there are 8 days in a week- Sunday to Saturday and another day called Oz day. There are 36 hours in a day and each hour has 90 min while each minute has 60 sec. As on earth, the hour hand covers the dial twice every day.

Find the approximate angle between the hands of a clock on Oz when the time is 12:40 am.

Solution: 89 deg

36 hours a day means the clk will be of 18 hours.

18 hours covers 360 deg

Thus 1 hour covers 20 deg

12 hours covers  $12 \times 20 = 240$  deg

ekhon, 1 hour in 90 min

thus in 90min the hour hand goes 20deg

hai, for 1min hr hand goes  $\frac{20}{90}$  deg

se jonne, for 40 min hr hand goes  $(\frac{20}{90}) \times 40 = \frac{80}{9}$  deg  $\approx 9$  deg (approx)

thus hr hand covers total of  $240 + 9 = 249$  deg

now min hand covers  $40 \times 4 = 160$  deg

(karon, 90min = 360deg)

1min = 4deg

thus angle between them  $249 - 160 = 89$  deg

10. Alok and Bhanu play the following min-max game. Given the expression  $N = 15 + X(Y - Z)$  Where X, Y and Z are variables representing single digits (0 to 9), Alok would like to maximize N while Bhanu would like to minimize it. Towards this end, Alok chooses a single digit number and Bhanu substitutes this for a variable of her choice (X, Y or Z). Alok then chooses the next value and Bhanu, the variable to substitute the value. Finally Alok proposes the value for the remaining variable. Assuming both play to their optimal strategies, the value of N at the end of the game would be?

Note: For this type of questions:

$$x + y - z = 11$$

$$x - y - z = 2$$

$$x \times (y + z) = 18$$

What should be the approach to do such type of prob?

Solution: This question was repeated 3 times for different cases

Yeah TCS has this 3 type of questions where there is

$$x + y - z = 11$$

$$x - y - z = 2$$

$$\text{and } x \times (y + z) = 18$$

TR QUESTIONS:

mam: what is ur name.

me: i am prem prakash. do not say my self

mam: Explain ur project in detail.

me: i told. be prepared with ur project in detail.

mam: what is transistor. explain cb, ce and cc as an amplifier.

me: i told. i had given the favourite subjects as edc and data comm. be prepared with two subjects or more.

***Visit [www.downloadmela.com](http://www.downloadmela.com) for more papers***

mam:explain full wave rectifier.  
me: i explained.

mam: what is emi(electro magnetic induction).  
me : i told.

mam: write a program for leap and non leap year.  
me: i told.plz be prepared with c.programs like factorial,swaping,prime no.,fibonacci series etc are imp.

mam: do yuo want to ask any question?  
me :plz ask questions .

I asked: mam right from now i have 4-5 months then how will i utilize this time so that it becomes beneficial for me as well as for ur organisation.

### **HR round:**

Again another mam:

mam:what is ur name?  
me : told

mam:again about project but not in detail.  
mam:about my training.

mam :my family background.  
mam:Would you be willing to relocate if required?

mam: lastly, do yuo want to ask any question?
